

A human-led, Gemini-powered tool for entry-level job seekers.

Step 1: Paste your resume

Resume text

Projects:

AEMR Energy Analysis Project

- * Used SQL to clean and analyze energy outage data
- * Built Tableau visuals to explain outage trends
- * Created presentation slides to explain business insights

Portfolio:

Built dashboards and data analytics projects using SQL, Python, and Tableau.

Step 2: Paste the job description

Job description

Entry-Level Data Analyst

We are looking for a junior data analyst to help clean, analyze, and visualize business data. The candidate should know SQL, Excel, and dashboard tools such as Tableau or Power BI. Python experience is helpful. Responsibilities include preparing reports, finding trends, creating dashboards, and explaining insights to business teams.

Analyze my fit

Result

Here's an analysis of your resume for this job description:

1. Job fit score out of 100: 90/100

You are an *excellent* fit for this role. Your skills and project experience align almost perfectly with what the job description is asking for.

2. Top matching skills:

- SQL
- Excel
- Tableau / Power BI (You have both, the JD asks for either)
- Python (listed as "helpful" in JD, you have it)
- Data Cleaning
- Data Visualization / Dashboarding
- Analyzing Data / Finding Trends
- Explaining Insights / Presentation Skills (demonstrated in your project)

3. Missing skills: Truthfully, there are very few direct "missing" skills.

- **"Preparing reports"** is mentioned in the JD. While your "presentation slides to explain business insights" is very similar, explicitly mentioning "reports" might be a tiny gap.
- **Quantifying impact:** Your project describes what you *did*, but not necessarily the *impact* or *results* of your work (e.g., "identified X% increase in outages due to Y," or "insights led to a potential cost saving of Z"). This isn't a "missing skill" as much as a "missing demonstration" of value.

4. Resume improvement suggestions:

- **Add a "Summary" or "About Me" section:** Start your resume with a brief 2-3 sentence paragraph that highlights your enthusiasm for data analysis, your key skills (SQL, Tableau, Python), and your goal (e.g., "Motivated Entry-Level Data Analyst with a strong foundation in SQL, Excel, Python, Tableau, and Power BI, eager to apply analytical skills to solve business problems and derive actionable insights.").
 - **Quantify your project:** For your AEMR Energy Analysis Project, try to add a hypothetical (or real, if possible) number or outcome. For example:
 - "Used SQL to clean and analyze energy outage data, **identifying a 15% increase in outages in specific regions.**"
 - "Built Tableau visuals to explain outage trends, **uncovering key seasonal patterns that could inform maintenance schedules.**"
 - "Created presentation slides to explain business insights, **leading to recommendations for improved resource allocation.**" Even if the numbers are estimates for a project, it shows you think about business value.
 - **Expand on your "Portfolio" section:** Instead of one general line, briefly list 2-3 specific projects from your portfolio (if they are different from the AEMR one) with a very short 1-line description for each, and a clear link to your full online portfolio. This gives a recruiter a quick snapshot of your breadth of work.
 - **Ensure clear contact info:** Make sure your phone, email, and LinkedIn profile link are prominently displayed at the top.
5. **Project idea to improve fit:** While your current project is good, to specifically target the "business data" aspect more explicitly (your current is "energy outage data"), consider a **Customer Analytics Project**:
- **Project Title:** E-commerce Customer Churn Analysis
 - **Objective:** Identify factors contributing to customer churn and recommend strategies to improve retention.
 - **Tools:** SQL, Python, Tableau/Power BI
 - **Steps:**
 1. **Data Acquisition:** Find a public dataset (e.g., on Kaggle) related to e-commerce customer transactions and demographics.
 2. **SQL for Cleaning & Aggregation:** Use SQL to clean the data, calculate key metrics (e.g., customer lifetime value, average order frequency), and identify churned customers.
 3. **Python for Deeper Analysis:** Use Python (Pandas for data manipulation, Matplotlib/Seaborn for advanced visualization, Scikit-learn for basic predictive modeling like logistic regression to identify churn drivers).
 4. **Dashboarding:** Build an interactive Tableau or Power BI dashboard to visualize customer segments, churn rates, and key metrics.
 5. **Insights & Report:** Summarize your findings in a brief report or presentation slides, highlighting key drivers of churn and suggesting actionable strategies for the business to retain customers.
- This project would directly demonstrate your ability to work with typical "business data" and provide actionable insights.
6. **7-day action plan:** Here's a practical plan to get you ready for applications:
- **Day 1: Resume Summary & Contact Polish (1-2 hours)**
 - Write a compelling 2-3 sentence "Summary" for the top of your resume.
 - Double-check all your contact information (phone, email, LinkedIn, portfolio link) is clear and accurate.
 - Save your updated resume as a PDF.
 - **Day 2: Quantify Project Impact (1-2 hours)**
 - Review your "AEMR Energy Analysis Project" and add specific, quantified outcomes or insights for each bullet point (even if hypothetical, e.g., "identified a *potential* 15% increase...").
 - **Day 3: Portfolio Section Expansion & LinkedIn Update (2-3 hours)**
 - Briefly list 2-3 *additional* projects (if you have them) from your portfolio on your resume, each with a 1-line description and a direct link to the project on your online portfolio.
 - Update your LinkedIn profile with your refreshed resume details.

- **Day 4: Company Research & Application (2-4 hours)**
 - Research 3-5 companies (including the one for this job) that interest you. Understand their business, values, and what they do.
 - Tailor your resume slightly for each application if needed (e.g., swapping Tableau for Power BI if they prefer one).
 - Start applying to 2-3 roles.
 - **Day 5: Interview Prep - Behavioral (2 hours)**
 - Practice answering common behavioral interview questions: "Tell me about yourself," "Why data analysis?", "Why this company?", "Tell me about a time you faced a challenge," "What are your strengths/weaknesses?"
 - **Day 6: Interview Prep - Technical (2-3 hours)**
 - Review fundamental SQL concepts (JOINS, GROUP BY, WHERE clauses, aggregate functions).
 - Be ready to walk through one of your Tableau or Power BI dashboards and explain your design choices and insights.
 - Brush up on basic Python data manipulation (Pandas).
 - **Day 7: New Project Brainstorm & Data Sourcing (1-2 hours)**
 - Spend time outlining the "E-commerce Customer Churn Analysis" project idea (or a similar business-focused project).
 - Search for relevant datasets on Kaggle or other public data sources to kickstart this project for future applications.
-
